## Installation, connection and programming manual

No. 1467

## Murax P110 Shutters and Dentel grille

## S2000 Operator with CS 300 Box

(Document reserved for installers)

## Contents

Equipment required for installation ..... p. 2
Installation instructions ..... p. 3
Information on the operator ..... p. 4
Installing the shutter or the grille ..... p. 5
Connecting the CS300 box and the operator ..... p. 14
Selecting a language (with the LCD screen) ..... p. 16
Setting the end positions (on the LCD screen) ..... p. 16
Overview of the LCD screen ..... p. 17
Default parameters table(mode architecture) ..... p. 18
Selecting the operating mode:

- Sustained pressure operation ..... p. 19
- Combined operation ..... p. 20
- Pulse operation ..... p. 21
- Automatic operation ..... p. 22
Partial opening ..... p. 22
Connecting the safety devices ..... p. 23
Overview of functions ..... p. 24
Finishes, in case of problems maneuvering the shutter ..... p. 30
In case of incorrect functioning of the operator ..... p. 30
Display of faults and solutions ..... p. 31
Emergency operation ..... p. 33

## Equipment required for installation

## - Lifting equipment

- Clamps
- Spirit level
- Plumb bob
- Tape measure (5m)
- Hammer drill
- Flat wrenches: 8, 10, 15 and 17 mm
- Hexagon keys: 5 mm
- Socket wrenches: 10, 15 and 17 mm
- Screwdriver
- Grease and brush
- Multi-grip pliers

## Installation instructions

## CAUTION!

To ensure that this product is assembled, used and maintained in complete safety, it is important to follow
the instructions provided in this document. For everyone's safety, please observe the precautionary measures below.

* Before beginning the assembly, read this manual carefully.
* This closure must be installed by a professional technician.
* All the parts delivered are specifically sized for this product. Adding and/or using other parts may be detrimental to safety and may affect the product's warranty.
* Any modification or improvement of this closure must be compliant with the standard EN 13241 + A2. In this case, a "modification/transformation" file must be created by the installer as per the standard EN 12635 annex C.
* Considerable force is exerted in the case of a shutter or a grille. This work must therefore be carried out in accordance with the safety instructions. Use the appropriate tools to install these products. Ensure that the work is carried out on a stable floor.
* Ensure that the assembly area is adequately lit, clear, clean and clearly marked out.
* Ensure that no other people are present at the assembly site apart from the installers. Non-authorized persons (children for example!) who are present at the site risk injury during assembly.
* All the components of this closure must be installed in compliance with the installation instructions provided in this manual.
* All the requirements of the standards EN $13241+$ A2 must be met and verified if necessary.

## Max. locking torque:

- Assembly screw: 10 Nm
- Shutter clip screw: 12 Nm

## Min. working load per attachment point:

- Plates: $\mathbf{3 0 0}$ daN
- Guiding rails: 40 daN

Please note: If installing on an iron structure, the guiding rails and plates can be welded to the building. In this case, a cord of approximately 50 mm must be attached to each side, roughly 800 mm apart.

## Information on the operator

| Reduced torque time (Nm) | 2000 |
| :--- | :---: |
| Maximum locking torque (Nm) | 6529 |
| Reduced speed (min-1) | 8 |
| Operator power (kw) | 2.5 |
| Operating voltage (V) | $400 / 3 \sim+$ Neutral |
| Power supply frequency (Hz) | 50 |
| Input voltage (V) | 24 |
| Nominal motor current (A) | 8.1 |
| Max. activations per hour | 20 |
| Operator continuous operation time (\%) | $53 \times 1.5$ |
| Power supply under your responsibility (mm $\left.{ }^{2}\right)$ | 10.0 |
| Protection under your responsibility (A) | 54 |
| Protection class (IP) | $-20 /+60$ |
| Temperature range ( $\left.{ }^{\circ} \mathrm{C}\right)$ | $<70$ |
| Continuous noise level (dB (A)) | 81 |
| Unit weight (kg) | 36 |
| Max. number of reduced rotations | 55 |
| Hollow shaft $\varnothing$ (mm) | 20 |

## Installing the guiding rails and the axle

The clearances for the hurricane slides and the noise reduction clips vary, refer to the corresponding manual which is included in the accessory pack.

| End-slat |  |
| :---: | :---: |
| The inner clearance on each side must be observed <br> in accordance with the depth of the guiding rail |  |
| Bottom clearance of guiding rail | Depth of guiding rail |
| 8 mm | $40 / 60 \mathrm{~mm}$ |
| 8 mm | $80 / 100 \mathrm{~mm}$ |

| Intermediate slats or Corrugated tubes |  |
| :---: | :---: |
| The inner clearance on each side must be observed <br> in accordance with the depth of the guiding rail |  |
| Bottom clearance of guiding rail | Depth of guiding rail |
| 8 mm | $40 / 60 \mathrm{~mm}$ |
| 12 mm | $80 / 100 \mathrm{~mm}$ |

*Shim

Operator side: It is essential to leave a space of 520 mm at the back of the guiding rail to accommodate the operator.

1!Opposite side to the operator: It is essential to leave a space of 140 mm at the back of the guiding rail to install the bearing and the clamping washer.

1 - Provisionally attach the guiding rails using the clamps.

- Position the end-slat horizontally (a shim may potentially be needed at the bottom of the guiding rail*), ensuring that the clearance is respected.
- Check that the guiding rails are plumb.
- Permanently attach the guiding rails.

2 - Opposite side to the operator (OO) and Operator side (OS): - Disassemble the two upper half winding plates.

3 - Operator side (OS):

- Firmly attach the support to the wall with the steel pins and 10 screws TH M12 (pins and screws not provided).

4 - Opposite side to the operator (OO):

- Firmly attach the support to the wall with the steel pins and 6 screws TH M12 (pins and screws not provided).

The weight of the shutter is carried by the operator and the bearing supports; therefore these supports must be attached to the wall very carefully.

Opposite side to the operator (OO)
5 - Install the axle:

- Position the axle on the two lower half-plates.
- Fit the bearing onto the shaft, positioning it on its support while ensuring it is centered on the half-plate.
- Screw the bearing in place with the 2 bolts M16x50.

6 - Screw the clamping washer to the end of the shaft with the FHC M8x16 screw with threadlock.

Operator side (OS)
7 - Install the operator: Fit the operator onto the keyed shaft

The axle must be parallel with the header and the keyed shaft must be centered on the plate.

Position the operator on its support and attach it with 2 bolts M14x60 and 4 washers of 14 mm.

Reassemble the two upper half winding plates and attach them to the wall.

The front plates must remain parallel throughout the entire operation, so use additional supports (not provided).

8 - Once the structure is assembled, check:

Opposite side to the operator (OO)

Shoulder abuts the bearing

Operator side (OS)

Between the shoulder and the operator

## Shutter installation principle

## Rolling direction

## SOLID OR MICROPERFORATED MURAX SHUTTER

A Microperforated shutter always requires 3 full roller slats in the upper section

Inner rolling

Outer rolling

## DENTEL SHUTTER

## A Dentel shutter always requires 3 full roller slats in the upper section <br> Inner rolling <br> Outer rolling

## Assembling the Murax shutter

## The height and the rolling of the shutter are calculated with a

 precise number of slats. All the slats provided must be installed.How the shutter is assembled depends on the space available on the assembly site at the back of the guiding rails.

## Case No.1: You have plenty of space

You have, on one side at least, a length longer than the length of the slats (for example: installation on the facade of a building)

1- Assemble (roughly) a meter's length of the shutter on the floor using the shutter clips.

The rolling direction

2- Attach the shutter to the axle, letting the slats hang outside of the guiding rails.(1)

Before fully tightening the clamp screws, ensure that the screw heads are not touching the slat flanges during rolling. If so, adjust all the clips so that they are at the same distance using the apertures.

Then, insert each slat from the side until the end-slat.(2)(3)

- Align the ends of the slats.

$\triangle$
If using hurricane end-pieces refer to the corresponding manual for the order of slats with end-pieces.

4- Roll the shutter above the start curves.

- Unroll the shutter in the guiding rails.(4)

5- Lower the shutter again ensuring that the slats are aligned.

6- Remember to adjust the start curves.

## Case No.2: You do not have any space

You do not have any space at the back of the guiding rails (for example, installation in a corridor)

1- Create the shutter by threading the slats together, without forgetting the clips. (1)

2- Roll the assembled shutter starting from the clips and moving towards the end-slat.(1)

3- Lift the shutter up to the tube using a hoist or an alternative lifting system.

4
To avoid scratching the slats while unrolling them, ensure that the axle is protected (e.g. with a box, etc.).

- Unroll the shutter in the guiding rails starting from the end-slat. (2)

5- Attach the shutter to the tube using the clips.
Before fully tightening the clamp screws, ensure that the screw heads are not touching the slat flanges during rolling. If so, adjust all the clips so that they are at the same distance using the apertures.

6- Remember to adjust the start curves. (5)

## Case No.3: You do not have enough space

You do not have enough space inside and the board is not very thick (for example: Installation inside a building with small reservations)

## The rolling direction

1 - Assemble 12 to 15 slats on the axle outside of the guiding rails.
2 - Position them to the side of the assembled part of the shutter.
3 - Slide on the slats one by one from the outside until the end-slat.
4 - Reposition the shutter behind the guiding rails.
5 - Align the ends of the slats.
6 - Raise the shutter and insert the end-slat in the guiding rails.
7 - Lower the shutter again, checking that the slats pass through the guiding rails.
8 - Remember to adjust the start curves.

## Assembling the Dentel shutter

1- Insert the end-slat into the bottom clips. (1)

2- Insert the 3 full slats into the top clips. (2)

## The rolling direction

3- Insert the shutter clips into the top slat. (3)

4- Attach at least 2 hoists to the wall above the axle.

- Attach the hoists to the grille, 1 m above the shutter;
- Install the grille using the hoists and position the slats around the axle.(4)

5- Slide each clip into place until it is opposite its corresponding hole.

- Screw the clips to the shutter on the axle using the screws HC M8x16.(5)

Before fully tightening the clamp screws, ensure that the screw heads are not touching the slat flanges during rolling. If so, adjust all the clips so that they are at the same distance using the apertures.
$6-$ Roll the shutter above the start curves.

- Unroll the shutter in the guiding rails. (6)

7- Remember to adjust the start curves.

(6)
p. 12

## Assembling the end-slat supports

## $150 \times 20$ Corner piece for the end slats in the following cases:

- Galva Murex 110 if $4,000 \leq$ WIDTH $<5,000 \mathrm{~mm}$
- Laquered Murex 110 if $3,000 \leq$ WIDTH $<5,000 \mathrm{~mm}$

$\underline{\mathbf{2 5} \times 20}$ Corner pieces for the end slats in the following cases:
- Galva Murex 110 if WIDTH < 5,000 mm
- Laquered Murex 110 if WIDTH < $5,000 \mathrm{~mm}$
- Dentel if WIDTH $\geq 5,000 \mathrm{~mm}$

## Connecting the CS 300 box

## Description:

x0 = Main power supply and operator cable terminal block
x3 = Control connection terminal block
x4 = Safety device connection terminal block
K3 = OPEN Contactor
$\mathrm{K} 4=$ CLOSE Contactor
x11 = AWG Terminal block - Digital limit-switches

Ensure the power line is protected using an upstream differential circuit-breaker.
Ensure that in close proximity to the operator, there is:

- A thermal protection device for the operator.
- A power cut-off system, which is accessible to the user.

## Connecting the operator

X4 Terminal strip (for safety edge 8.2 kOhm )

## Selecting a language (with LCD screen)

6- Return to INPUT mode, by holding down + and - for $>1 \mathrm{~s}$

## Setting the end positions

On the LCD screen

- Select the ADJUSTMENT mode,by holding down the $\mathbf{P}$ button $\longrightarrow$

| ADJUSTMENT <br> STANDBY |  |
| :--- | :--- |

## - Setting the top end position:

Move the door to the required OPEN end position, by pressing the + button.

$\triangle$If the door does not rise, change the operator rotation direction by switching the $U$ and $V$ wires on the $x 0$ terminal block.

Record the OPEN end position, by holding down the $\mathbf{P}$ button and then holding down the + button until the following display appears

## - Setting the bottom end position:

Move the door to the required CLOSE end position, by pressing the - button.
Record the CLOSE end position, by holding down the $\mathbf{P}$ button and then holding down the - button until the following display appears $\qquad$

- The end positions have now been set.
- Exit the ADJUSTMENT mode, by holding down the $\mathbf{P}$ button until AUTOMATIC mode is selected.

## Overview of the LCD screen

A - Operating mode / Diagnostic info
B - Parameter / Diagnostic info
C - Button (+)
D - Button (-)
E-Button (P)
F - Value / Status
G - Value / Status
H - Jumper

Selecting a mode on the LCD screen (A):
By holding down the P button, you can select the following modes:

## 1 - AUTOMATIC 2 -ADJUSTMENT 3 -INPUT 4 -DIAGNOSTIC

Please note: If the $\mathbf{H}$ jumper is removed, the $(+),(-)$ and $(\mathbf{P})$ buttons will not work. The screen display will continue to work

## Description of mode 1: AUTOMATIC

The door will operate in this mode.
On the screen: - The operating mode is displayed (e.g.: AUTOMATIC).

- The shutter status or potential faults are displayed (e.g. STANDBY).

Please note: If the "Auto-hold" parameter is set on MOD2 or MOD3 in the INPUT menu, the screen display will change from AUTOMATIC to MANUAL mode.

Description of mode 2: ADJUSTMENT = Setting the end positions.

$\triangle$In ADJUSTMENT mode, there is no stop position because the limit-switches are deactivated. Overrunning the end positions may damage the door.

On the screen: - The end position value is displayed.

## Description of mode 3: INPUT = Modification of different parameters for shutter operation.

On the screen: - The selected parameter is displayed.

- The set value / status is displayed.

## Description of mode 4: DIAGNOSTIC = The status of the controls and safety devices is displayed.

On the screen: - The components to be checked are displayed.

- The checked component value is displayed.

## Default parameters table Mode architecture (standard factory settings)

| PHOTO CELL | ON |
| STOP CHAIN | ON |
| CYCLE | 4 |
| ENCODER | 2599 |

## Selecting the operating mode

## - Set the end positions before selecting the operating mode. <br> - The fixed controls must be installed within sight of the door but away from any moving parts and at a height of at least 1.5 m from the floor. <br> - Use one switch for a single operator. It is completely prohibited to order several operators with a single monopolar switch.

## Sustained pressure operation

 Sustained ascent / descentOnly the control requiring sustained action should be installed and used.

- Parameters to be modified for sustained pressure operation:
(Refer to the parameter table for parameter functions)

| AUTO-HOLD | Mod2 | Sustained pressure operation |
| :--- | :--- | :--- |

## Combined operation

## Pulse ascent - Sustained descent

## - Connection of the controls:

- Parameters to be modified for combined operation:
(Refer to the parameter table for parameter functions)

| AUTO-HOLD | Mod3 | Combined operation |
| :--- | :---: | :---: |

## Pulse operation <br> Pulse Ascent/Descent

## - Connection of the controls:

Please note: If operating with the remote control, refer to the corresponding receiver box manual.

- Check: (Refer to the parameter table for parameter functions)

| OPENING TIME | 0 | If $>0$ : Automatic operation |
| :--- | :--- | :--- |

- Parameters to be modified for pulse operation:
(Refer to the parameter table for parameter functions)

| MOVEMENT TIME | $?$ | To be defined according to the shutter height, opening time + 4s |
| :--- | ---: | :--- |
| WARNING | 2 | Alert before closing (flashing light) |
| RELAY 1 | 2 | Flashing light |
| RELAY 2 | 25 | Lighting of area |
| SHOCK WAVE V | ON | Safety edge with auto-test |
| DELAYED OPEN. | ON | Alert before opening |
| AUTO-HOLD | 1 | Pulse operation |
| P/C CLOSE | 2 | Photo cells when closing |

## Automatic operation <br> Pulse ascent and automatic re-closing

The timed re-closing is integrated into the automatic operating mode (no manual control) (cf: NF EN 12453 - NF EN 13 241-1)

* Ensure that the mandatory protection levels are in place for automatic operation
- Connection of the controls:

Please note: If operating with the remote control, refer to the corresponding receiver box manual.

- Parameters to be modified for automatic operation:
(Refer to the parameter table for parameter functions)

| MOVEMENT TIME | $?$ | To be defined according to the shutter height, opening time + 4s |
| :--- | ---: | :--- |
| OPENING TIME | 10 | lf 0: pulse operation |
| WARNING | 2 | Alert before closing (light flashes) |
| RELAY 1 | 2 | llashing light |
| RELAY 2 | 25 | Lighting of area |
| SHOCK WAVE V | ON | Safety edge with auto-test* |
| DELAYED OPEN. | ON | Alert before opening |
| AUTO-HOLD | 1 | Automatic operation |
| P/C CLOSE | 2 | Photo cells when closing* |

## Partial opening

(Refer to chapter 'Overview of functions': SUMMER/WINTER)

X4 Terminal strip
 switch
$\longleftarrow$ CS 300 Box terminal block

Programming: Open the shutter to the required height, then note the value displayed in ADJUSTMENT mode. Next, go to INPUT mode and program the OPEN PRE-EP with this value.

| OPEN PRE-EP | 4000 | Settings from 0-8190 (example 4000) |
| :--- | :--- | :--- |

## Connecting the safety devices

## Bottom safety edge with auto-test

X4 Terminal strip

CS 300 Box terminal block

Safety edge

## Setting the sensitivity:

Adjust the potentiometer to minimum, the LED should switch off. Turn up the potentiometer until the LED light switches on, then close the window.

Please note: If the safety edge is faulty, the operating mode will automatically switch to combined operation.

## Orange flashing lights (option) <br> 230V - MAX. $2 \times 15$ W

## Explanation of relay modes:

- Light functions:

| MOD | Name | Close end <br> position | Open end <br> position | Warning | Door <br> movement |
| :--- | :--- | :--- | :--- | :--- | :--- |
| MOD1 | Red light 1 | On/Off* | Stop | Flashing | On |
| MOD2 | Red light 2 | On/Off* | Stop | Flashing | Flashing |
| MOD3 | Red light 3 | On/Off* | Stop | On | On |
| MOD18 | Red light 4 | Stop | Stop | Flashing | Stop |
| MOD23 | Green light | Stop | On | Stop | Stop |

* According to parameter MOD1-3 STANDBY
- Position messages:

| MOD | Name | Comments |
| :--- | :--- | :--- |
| MOD6 | Open end position | The relay closes the contact if the door is in the open end position |
| MOD7 | Close end position | The relay closes the contact if the door is in the close end position |
| MOD8 | No open end position | The relay closes the contact if the door is not in the open end position |
| MOD9 | No close end position | The relay closes the contact if the door is not in the close end position |
| MOD10 | Primary open end <br> position <br> (partial opening) | The relay closes the contact if the door is in the primary open end position (partial <br> opening) |
| MOD11 | Primary close end <br> position | The relay closes the contact if the door is in the primary close end position |
| MOD12 | Primary close end <br> position up to close <br> end position | The relay closes the contact if the door is between the primary close end position <br> and the close end position |
| MOD19 | Primary open end <br> position up to open <br> end position | The relay closes the contact if the door is between the primary open end position <br> (partial opening) and the open end position |

## - Pulse signals:

| MOD | Name | Comments |
| :---: | :--- | :--- |
| MOD4 | Pulse in opening <br> command | The relay closes the contact for 1 second if the door receives an opening <br> command. With this pulse, it is possible to control the light, for example. |
| MOD27 | Pulse after having <br> reached the open end <br> position | The relay closes the contact for 2 seconds when the door reaches the open <br> end position. <br> With this pulse, it is possible to open the next partition, for example. |

- Brake functions:

| MOD | Name | Comments |
| :--- | :--- | :--- |
| MOD14 | Brake | The brake rectifier switch is controlled by the relay to ensure quicker functioning of <br> the brake. The contact is closed and the brake is therefore released as soon as the <br> door moves (quiescent current brake). |
| MOD15 | Reverse brake | The brake rectifier switch is controlled by the relay to ensure quicker functioning <br> of the brake. The contact is open and the brake is therefore released as soon as <br> the door moves (operating current brake). |
| MOD16 | During opening, the <br> brake remains ON | The brake rectifier switch is controlled by the relay to ensure quicker functioning <br> of the brake. The contact is closed and the brake is therefore released as soon <br> as the door moves (operating current brake). So that the door stops smoothly at <br> the upper end position, the contactor is not switched in the open end position <br> (opening time). |

- Error messages:

| MOD | Name | Comments |
| :---: | :--- | :--- |
| MOD5 | Fault signal | The relay closes the contact when there is a stop or error command. All the errors <br> in the chapter 'display of faults and solutions' will activate the relay. |
| MOD17 | Safety edge device <br> activated | The relay opens the contact when the safety edge is activated. A fault with the <br> safety edge or a fail test is displayed from MOD5. |

## - Functions for external accessories:

| MOD | Name | Comments |
| :--- | :--- | :--- |
| MOD13 | Magnetic latch function | The relay is open in close end position. If an open command is then received, the <br> relay closes and stays closed until the close end position is reached once more. <br> lf more time is required for opening the magnetic latch, this setting can be changed <br> in the delayed opening and warning parameters. |
| MOD20 | Opto-transmission <br> system activation | Before each close command, the Opto transfer system is activated and remains <br> activated during closing. Closing will be delayed by roughly 0.5 seconds because <br> this system is activated. |
| MOD21 | Anti-lift safety <br> device test | The relay produces a test signal once the close end position has been reached and <br> it waits until the stop circuit is activated in response to the test signal. |
| MOD22 | External safety <br> device test | The relay produces a test signal once the open end position has been reached and <br> it waits until the safety edge input is activated in response to the test signal. |
| MOD24 | Condenser activation | For each move command, the relay is closed for roughly 1 second. Using this <br> relay, a starter condenser required for a single-phase current is activated to ensure <br> the operator starts up safely. |
| MOD25 | Courtyard light <br> function | For each open command, the relay is closed for 2 minutes and it is therefore <br> possible to use it to control the lighting. |
| MOD26 | Radio transmission <br> system activation | Before each stop command, the radio transmission system is activated with a <br> pulse. The activation time must be set in the transmission system. The <br> activation of the system enables delayed closing of roughly 0.5 seconds. |
| MOD28 | Relay close function | The relay remains open |

DIAGNOSTIC mode:

| Display | Meaning |  |
| :--- | :--- | :--- |
| TOP EP | Open end position | OFF: Activated <br> ON: Deactivated |
| BOT EP | Close end position | OFF: Activated <br> ON: Deactivated |
| OPEN BUTTON | Open button | ON: Activated <br> OFF: Deactivated |
| PART OPEN | Partial open button <br> Connection to the X4 terminal strip (9 and 10) | ON: Activated <br> OFF: Deactivated |
| CLOSE BUTTON | Close button | ON: Activated <br> OFF: Deactivated |
| SAFETY EDGE | Safety edge | ON: The system is closed <br> OFF: The system has stopped (fault) |
| PULSE | Pulse Button | ON: Activated <br> OFF: Deactivated |
| TIMER | Weekly timer | ON: Activated <br> OFF: Deactivated |
| PHOTO CELL | Passing photoelectric cell | ON: Closed <br> OFF: Stopped (fault) |
| STOP CHAIN | Command stop button <br> Motorization stop system | ON: Closed <br> OFF: Stopped (fault) |
| CYCLE | Counter for number of door cycles | Door cycle display |
| ENCODER | Absolute value encoder | Door position value display |

## Finishes

## IMPORTANT!

Carefully grease the inside of the guiding rails and the winding plates

## In case of problems maneuvering the shutter

## If the anti-fall guard is blocked, contact a trained installer

If the shutter is crooked when moving up and down
(Gap larger than 4 cm on the end-slat)

Check that the slats are correctly aligned

NO
Remove any blockages from inside the guiding rails

Raise the shutter from the lowest side using the clip apertures provided for this purpose

Check that the guiding rails are correctly aligned and that the axle is perfectly horizontal

## In case of incorrect functioning of the operator

## Most importantly, never put the operator into continuous operation by directly activating the power contactors

Triple-phase operator: check the 400 V or 230 V voltage between each phase.
Check that the emergency operation control is not activated.

## Display of faults and solutions

| Fault or fault signal | Cause | Solutions |
| :--- | :--- | :--- |
| The door does not respond | - Power is off | - Check the power supply to the <br> operator and the box |
| After pressing the open button, the door <br> moves to the close end position <br> After pressing the close button, the door <br> moves to the open end position | - Rotating magnetic field incorrectly applied | - Check the rotating magnetic field and <br> create a clockwise rotating magnetic <br> field if necessary |
|  | - The stop circuit is interrupted <br> Terminal block X3 (1,2): Emergency stop, <br> electric slack rope switch, anti-lift safety device <br> Terminal block X6 (1,2): Internal on/off switch | Terminal block X11 (4,8): Motorization safety <br> circuit <br> Terminal block X2 (B1,B2): Bridge <br> Terminal block X3 (3,4): External stop button <br> Terminal block X7 (1,2): Internal stop button |
| STOP | - Check and close the stop circuit |  |

Please note: After having rectified the fault, it is necessary to switch the box, once the power is off.

## to be displayed next to the closure

## Emergency operation

1- Insert the crank into the operator as far as the stop (the operator power supply is cut off and the door cannot operate electrically).

2 - Turn the crank in one direction to open the door and in the other direction to close it.

3 - Once repairs are completed, remove the crank (the operator power is reactivated and the door can operate electronically).

$\triangle$
Never pull the operator brake when repairing the operator or when it is in operation.
